

ABSTRACT OF THE DISCLOSURE

5 A dental appliance, a system and a method for treating
malocclusions are provided wherein a need for patient
cooperation to treat the malocclusion may be reduced. The
dental appliance may cause teeth of the user to move into
a corrected position. As a result, the patient may not be
required to perform an amount of exercise, or like co-
operational action, normally required by the patient to
10 correct the malocclusion. In another embodiment, the
method of exercise or cooperation performed may reduce an
amount of time the dental appliance is worn in the mouth on
a daily basis.
